FDMS3660S

PowerTrench® Power Stage

Asymmetric Dual N−Channel MOSFET

ON Semiconductor®

www.onsemi.com

Description

This device includes two specialized N−Channel MOSFETs in a dual PQFN package. The switch node has been internally connected to enable easy placement and routing of synchronous buck converters. The control MOSFET (Q1) and synchronous SyncFET (Q2) have been designed to provide optimal power efficiency.

Features

Q1: N−Channel

- Max $r_{DS(on)}$ = 8 mΩ at V_{GS} = 10 V, I_D = 13 A
- Max $r_{DS(on)}$ = 11 mΩ at V_{GS} = 4.5 V, I_D = 11 A

Q2: N−Channel

- Max $r_{DS(on)}$ = 1.8 mΩ at V_{GS} = 10 V, I_D = 30 A
- Max $r_{DS(on)}$ = 2.2 mΩ at V_{GS} = 4.5 V, I_D = 27 A
- Low Inductance Packaging Shortens Rise/Fall Times, Resulting in Lower Switching Losses
- MOSFET Integration Enables Optimum Layout for Lower Circuit Inductance and Reduced Switch Node Ringing
- These Devices are Pb−Free and are RoHS Compliant

Applications

- Computing
- Communications
- General Purpose Point of Load
- Notebook VCORE

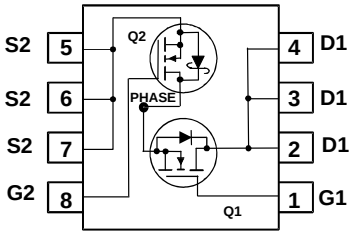
CASE 483AJ



ORDERING INFORMATION

See detailed ordering and shipping information on page 2 of this data sheet.

MAXIMUM RATINGS (T_A = 25°C unless otherwise noted)

Symbol	Rating	Q1	Q2	Unit
V_{DS}	Drain to Source Voltage	30	30	V
Bvdsst	Bvdsst (Transient) < 100 ns	36	36	V
V_{GS}	Gate to Source Voltage (Note 3)	±20	±12	V
I_D	Drain Current − Continuous (Package limited) (T_C = 25°C)	30	60	A
	Drain Current − Continuous (Silicon limited) (T_C = 25°C)	60	145	
	Drain Current − Continuous (T_A = 25°C)	13 (Note 6a)	30 (Note 6b)	
	Drain Current − Pulsed	40	120	
E_{AS}	Single Pulse Avalanche Energy	33 (Note 4)	86 (Note 5)	mJ
P_D	Power Dissipation for Single Operation (T_A = 25°C)	2.2 (Note 6a)	2.5 (Note 6b)	W
	Power Dissipation for Single Operation (T_A = 25°C)	1 (Note 6c)	1 (Note 6d)	
T_J, T_{STG}	Operating and Storage Junction Temperature Range	−55 to +150		°C

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

THERMAL CHARACTERISTICS

Symbol	Parameter	Q1	Q2	Unit
$R_{\theta JA}$	Thermal Resistance, Junction−to−Ambient	57 (Note 6a)	50 (Note 6b)	°C/W
$R_{\theta JA}$	Thermal Resistance, Junction−to−Ambient	125 (Note 6c)	120 (Note 6d)	°C/W
$R_{\theta JC}$	Thermal Resistance, Junction−to−Case	2.9	2.2	°C/W

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

1. $R_{\theta JA}$ is determined with the device mounted on a 1 in^2 pad 2 oz copper pad on a 1.5 x 1.5 in. board of FR−4 material. $R_{\theta JC}$ is guaranteed by design while $R_{\theta CA}$ is determined by the user’s board design.
2. Pulse Test: Pulse Width < 300 μs, Duty cycle < 2.0%.
3. As an N−ch device, the negative Vgs rating is for low duty cycle pulse occurrence only. No continuous rating is implied with the negative Vgs rating.
4. E_{AS} of 33 mJ is based on starting T_J = 25°C; N−ch: L = 1.9 mH, I_{AS} = 6 A, V_{DD} = 27 V, V_{GS} = 10 V. 100% test at L= 0.1 mH, I_{AS} = 16 A.
5. E_{AS} of 86 mJ is based on starting T_J = 25°C; N−ch: L = 0.6 mH, I_{AS} = 17 A, V_{DD} = 27 V, V_{GS} = 10 V. 100% test at L= 0.1 mH, I_{AS} = 31 A.

TYPICAL CHARACTERISTICS (continued)

SyncFET Schottky Body Diode Characteristics

ON Semiconductor's SyncFET process embeds a Schottky diode in parallel with PowerTrench MOSFET. This diode exhibits similar characteristics to a discrete external Schottky diode in parallel with a MOSFET. Figure 27 shows the reverses recovery characteristic of the FDMS001N025DSD.

Schottky barrier diodes exhibit significant leakage at high temperature and high reverse voltage. This will increase the power in the device.

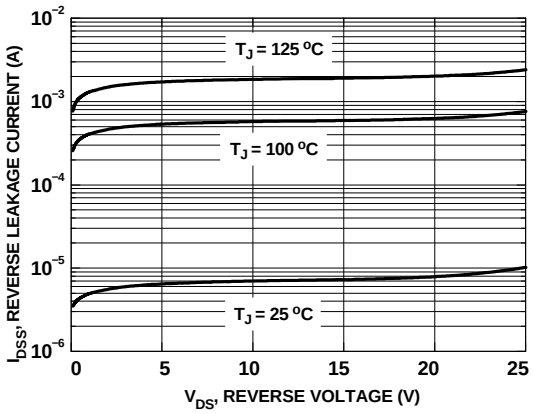

Figure 28. SyncFET Body Diode Reverse Leakage vs. Drain−Source Voltage

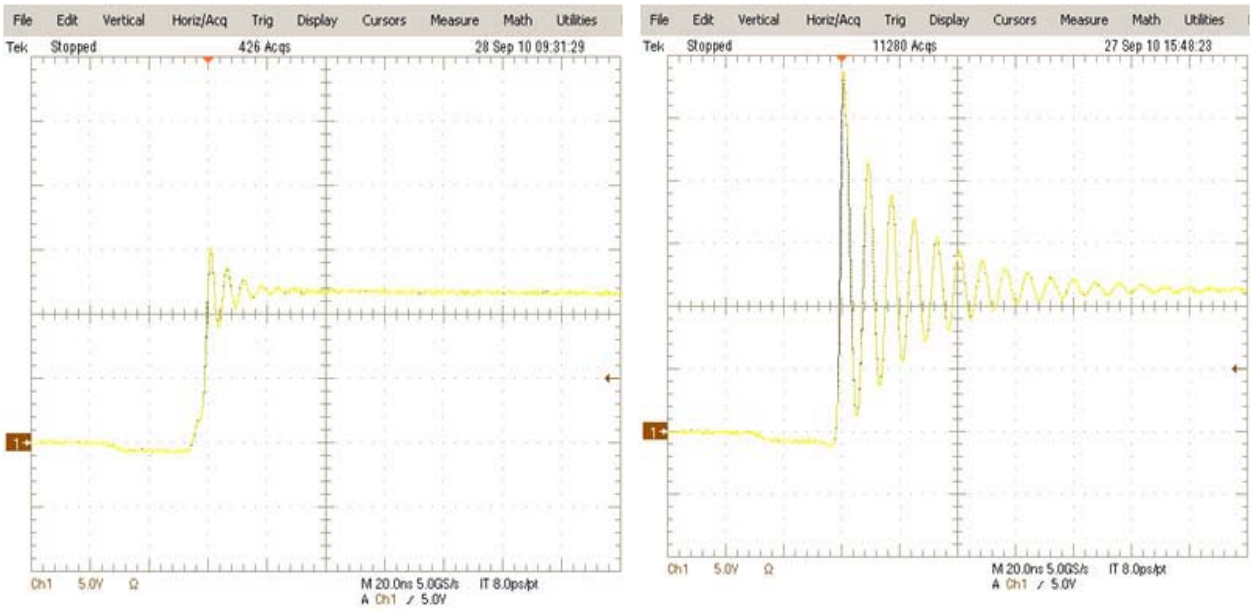
Application Information

Switch Node Ringing Suppression

ON Semiconductor's Power Stage products incorporate a proprietary design that minimizes the peak overshoot, ringing voltage on the switch node (PHASE) without the need of any external snubbing components in a buck converter. As shown in the Figure 29, the Power Stage solution rings significantly less than competitor solutions under the same set of test conditions.



Power Stage Device **Competitors Solution**

Figure 29. Power Stage Phase Node Rising Edge, High Side Turn On

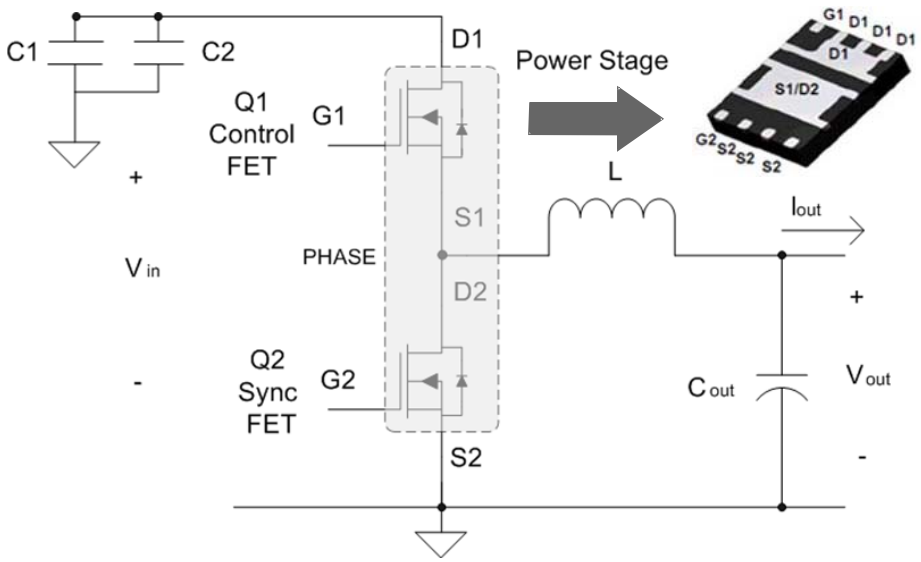


Figure 30. Shows the Power Stage in a Buck Converter Topology

Recommended PCB Layout Guidelines

As a PCB designer, it is necessary to address critical issues in layout to minimize losses and optimize the performance of the power train. Power Stage is a high power density solution and all high current flow paths, such as VIN (D1), PHASE (S1/D2) and GND (S2), should be short and wide for better and stable current flow, heat radiation and system performance. A recommended layout procedure is discussed below to maximize the electrical and thermal performance of the part.

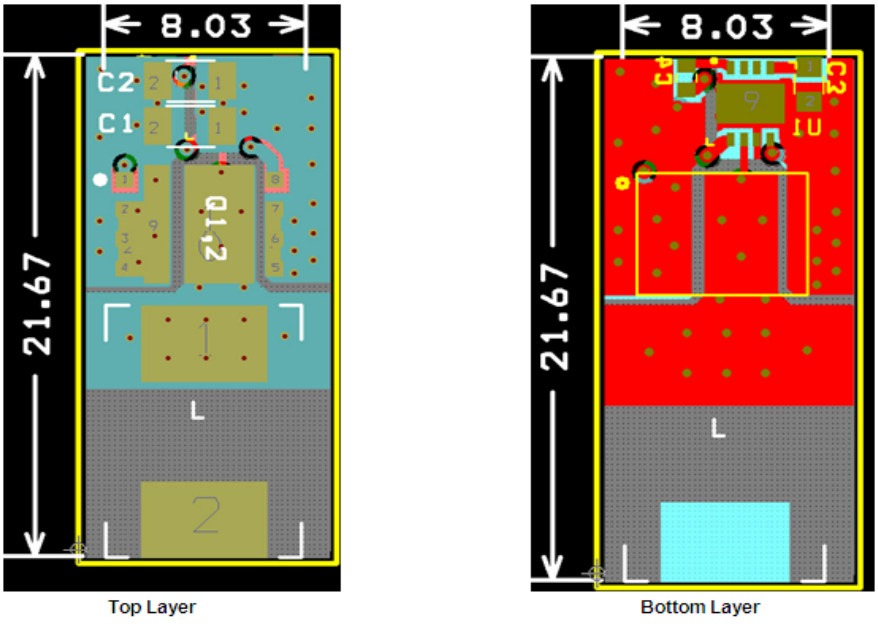

Figure 31. Recommended PCB Layout

Following is a guideline, not a requirement which the PCB designer should consider:

1. Input ceramic bypass capacitors C1 and C2 must be placed close to the D1 and S2 pins of Power Stage to help reduce parasitic inductance and high frequency conduction loss induced by switching operation. C1 and C2 show the bypass capacitors placed close to the part between D1 and S2. Input capacitors should be connected in parallel close to the part. Multiple input caps can be connected depending upon the application.
2. The PHASE copper trace serves two purposes; In addition to being the current path from the Power Stage package to the output inductor (L), it also serves as heat sink for the lower FET in the Power Stage package. The trace should be short and wide enough to present a low resistance path for the high current flow between the Power Stage and the inductor. This is done to minimize conduction losses and limit temperature rise. Please note that the PHASE node is a high voltage and high frequency switching node with high noise potential. Care should be taken to minimize coupling to adjacent traces. The reference layout in Figure 31 shows a good balance between the thermal and electrical performance of Power Stage.
3. Output inductor location should be as close as possible to the Power Stage device for lower power loss due to copper trace resistance. A shorter and wider PHASE trace to the inductor reduces the conduction loss. Preferably the Power Stage should be directly in line (as shown in Figure 31) with the inductor for space savings and compactness.
4. The PowerTrench Technology MOSFETs used in the Power Stage are effective at minimizing phase node ringing. It allows the part to operate well within the breakdown voltage limits. This eliminates the need to have an external snubber circuit in most cases. If the designer chooses to use an RC snubber, it should be placed close to the part between the PHASE pad and S2 pins to dampen the high−frequency ringing.
5. The driver IC should be placed close to the Power Stage part with the shortest possible paths for the High Side gate and Low Side gates through a wide trace connection. This eliminates the effect of parasitic inductance and resistance between the driver and the MOSFET and turns the devices on and off as efficiently as possible. At higher−frequency operation this impedance can limit the gate current trying to charge the MOSFET input capacitance. This will result in slower rise and fall times and additional switching losses. Power Stage has both the gate pins on the same side of the package which allows for back mounting of the driver IC to the board. This provides a very compact path for the drive signals and improves efficiency of the part.
6. S2 pins should be connected to the GND plane with multiple vias for a low impedance grounding. Poor grounding can create a noise transient offset voltage level between S2 and driver ground. This could lead to faulty operation of the gate driver and MOSFET.
7. Use multiple vias on each copper area to interconnect top, inner and bottom layers to help smooth current flow and heat conduction. Vias should be relatively large, around 8 mils to 10 mils, and of reasonable inductance. Critical high frequency components such as ceramic bypass caps should be located close to the part and on the same side of the PCB. If not feasible, they should be connected from the backside via a network of low inductance vias.
