

Dual D-Type Flip-Flop with Set and Reset

MC74VHC74, MC74VHCT74A

The MC74VHC74 and MC74VHCT74A are high speed CMOS D-Type Flip-Flops fabricated with silicon gate CMOS technology. These achieve high speed operation similar to equivalent Bipolar Schottky TTL while maintaining CMOS low power dissipation.

The signal level applied to the D input is transferred to Q output during the positive going transition of the Clock pulse.

Reset (\overline{RD}) and Set (\overline{SD}) are independent of the Clock (CP) and are accomplished by setting the appropriate input Low.

The MC74VHC74 inputs are compatible with standard CMOS levels while the MC74VHCT74A inputs are compatible with TTL levels. This device can be used as a level converter for interfacing 3.3 V to 5.0 V, because it has full 5.0 V CMOS level output swings.

The MC74VHC74 and MC74VHCT74A internal circuits are composed of three stages, including a buffer output which provides high noise immunity and stable output. The input structures tolerate voltages up to 5.5 V, allowing the interface of 5 V systems to 3 V systems.

The MC74VHCT74A output structures provide protection when $V_{CC} = 0$ V. These output structures help prevent device destruction caused by supply voltage – input/output voltage mismatch, battery backup, hot insertion, etc.
